Abstract – The Covid-19 pandemic accelerated an expansion of digital technologies, with many organizations redefining the skills of their workforce. This paper analyses the case of a digital marketing agency, operating in Lithuania for more than a decade. As the company's revenue model is based on the execution of successful projects, constant employee competency development is crucial to be resilient and maintain a competitive market position. Thus, this paper aims to determine the core digital project management competencies and propose a competence development plan. To achieve this aim, a scientific literature review and a semi-structured interview with project managers were carried out. The results revealed that the most important digital project management competencies are contextual knowledge, planning and communication skills and ability to adapt to a fast-changing environment. It was recommended to implement the following solutions: form an environment conducive to learning, organize internal knowledge-sharing sessions, promote mentoring/job shadowing, use external coaching services, and provide opportunities for the employees to attend professional conferences and online project management courses. These solutions ought to narrow the gap between the available and required digital project management competencies and help in coping with the challenges of rapid technological progress.

Keywords – digital project, digital project management, project management competencies, SME, resilience, Covid19

I. INTRODUCTION

In 2021, 68% of the 3,950 surveyed project professionals identified digital transformation as the biggest change in their business over the past 12 months [1]. Respondents represented a range of industries and regions, meaning that the pandemic fast-tracked the digitalization of project management all over the world. According to Wu [2], it includes digital tools, further embracement of the agile approach, working in remote teams, and breaking the geography and time zone barriers. Based on the insights of scientists [3] – [4], the following differences can be observed between the concepts of standard and digital projects (DP):

- Digital projects are not limited by geographical boundaries.
- Travel costs for digital projects are drastically lower.
- Digital projects use significantly larger amounts of information.
- The organization of documents for digital projects is more efficient.
- Digital projects require solid knowledge of information technology (e.g., cloud computing, analytics, mobile applications, digital commerce).

- In digital projects, the level of personal communication is much reduced.

Globally, about one-third of the projects fail or lose budget [1] and though project management competencies are among the key project management success factors [5], there has been a growing gap between the available and necessary skills [6]. Having in mind the before-described issues, digital project management (DPM) should consider not only the fundamentals of standard project management [7], but also the importance of information technologies, digital environment, and communication within remote teams [8] – [9]. Therefore, the demand for competent digital project managers with strong knowledge of information technology will continue to increase [10]. However, to date, there are no well-established standards of digital project management competencies that would facilitate the development of this specialty and contribute to the successful implementation of digital projects.

This paper aims to determine the core digital project management competencies by using a case of a digital marketing agency (here and after DMA) and to propose improvement solutions. The next sections of the article illustrate the research design, present the findings, describe the relevance for practice and provide conclusions.

II. RESEARCH DESIGN

Based on the proposed model by Cartwright and Yinger [11], there are three steps for the development of project management competencies:

1. **Assess the performance.** The purpose of this evaluation is to determine how the project manager meets the intended requirements and identify the space for improvement (for the case analysis, a semi-structured interview is employed, see details below).
2. **Plan project management competence development.** Using the data collected during the assessment, a competence development plan is drawn up. After arranging the priority areas, a plan for the improvement of competencies is prepared (for the case analysis, a list of recommendations is provided, see Section IV).
3. **Conduct PM competence development.** During this process, the project manager is responsible for the implementation of the development plan himself/herself. In other words, the organization provides support throughout the execution of the plan, but the final result will be determined by the efforts made by the employee.

Qualitative research is not subject to strict sample volume requirements [12]. Given the small number of employees of the analysed DMA (20) and even smaller number of its project managers (4), qualitative research is an excellent way to analyze the situation of the company. To properly prepare for the conduct of a semi-structured interview, a questionnaire was formulated. Four categories of interview questions are focused on sociodemographic details, the topic of digital project concept, DPM challenges, necessary competencies and opportunities for improvement.

Firstly, there are **general** questions that help in categorizing the interviewees and evaluating their experience in project management (see Table I).

TABLE I. GENERAL INTERVIEW QUESTIONS

Question No.	Question
1.1.	What is your age?
1.2.	What is your education level?
1.3.	How many years of experience in project management do you have?

Secondly, there are questions that help in understanding what, in project manager's opinion, are the **concepts of digital project and digital project management** (see Table II).

TABLE II. CONCEPTUAL INTERVIEW QUESTIONS

Question No.	Question
2.1.	How do you understand the concept of a digital project?
2.2.	In your opinion, how different is digital project management compared to the management of non-digital projects?
2.3.	What challenges do you face in digital project management?
2.4.	How do you address these challenges?

Thirdly, there are interview questions devoted to the analysis of the **DMA project managers' digital project management competencies** and current status (strengths and weaknesses), see Table III.

TABLE III. INTERVIEW QUESTIONS ON DIGITAL PROJECT MANAGEMENT COMPETENCIES

Question No.	Question
3.1.	What competencies are the most important for the management of digital projects?
3.2.	How would you assess your competencies?
3.3.	Which of your competencies are best developed?
3.4.	Which of your competencies are least developed?

The last interview questions aim to find out the **possibilities for competence improvement** (see Table IV).

TABLE IV. INTERVIEW QUESTIONS ON COMPETENCE IMPROVEMENT

Question No.	Question
4.1.	How could DMA improve the competencies of project managers (promote competence improvement)?
4.2.	How can a project manager improve competencies individually?

III. FINDINGS

Based on the data collected during the semi-structured interviews, the age of the interviewees ranges from 23 to 33 years. The relatively young age is not very surprising given the fact that the company works with digital marketing. It was also found out that all the project managers have a higher education: two respondents have bachelor's degrees and the remaining two own master's. The experience in the field of project management ranges from 1 to 10 years. To be specific, Project manager (PM) no 1 – 1 year; PM2 – 2,5 years; PM3 – 6,5 years and PM4 – 10 years of experience. Hence, it provides a great opportunity to look at digital project management competencies from the positions of project managers at very different levels. In other words, the insights of junior and senior project managers are taken into account.

Table V represents the answers about the concept of a digital project. Looking at the responses, it can be claimed that DMA project managers understand the digital project as follows: it is a project that takes place in the digital environment, has a beginning and an end, and is most often associated with information technology services or products. It can be noted that the concept of a digital project formed by the interview participants is close to the concepts of a digital project presented in the scientific literature, thus proposing that DMA employees fully understand what a digital project is.

TABLE V. ANSWERS ON DIGITAL PROJECT CONCEPT

Characteristic	Answer to 2.1. question
The project takes place in the <i>digital space</i> and on the <i>Internet</i>	"A project that takes place in the digital space" (PM1) "A digital project is in reality everything that is online and in the digital space, and that requires the use of digital tools" (PM3) "Digital project it is all that is online" (PM4)
Associated with <i>information technology services or products</i>	This is a project [...] let's say you have to run a digital product or service" (PM1) "CRO iterations, digital consumer testing ... it's such all kinds of digital jobs" (PM2) "The digital project ... this often means IT projects" (PM4)
Has a <i>starting and end point</i>	"The project should be shaped when it starts with something and there is the end point" (PM2) "The project ... where can you assess what your expectations are, the duration, what is the budget, what is the scope, and so on" (PM2)

Semi-structured interviews also sought to find out how, according to the DMA project managers, digital project management differs from non-digital project management. As the answers in Table VI reveal, DPM may be characterized by quick adaptability, relatively low dependence on the suppliers and a greater possibility to rely all decisions on data. However, it is difficult to forecast the schedule because of a high uncertainty related to the project outcomes.

TABLE VI. ANSWERS ON DPM SPECIFICS

Specifics	Answer to 2.2. question
Quick adaptability	"...Here you can adapt to the situation faster" (PM1)
Low dependence on suppliers	"You don't need so much of those physical resources, say you're not so dependent on suppliers" (PM1)
Possibility to rely on data	"Basing everything on the data is a very great advantage" (PM2) "Here we have the possibility to base everything on clear data" (PM4)

Specifics	Answer to 2.2. question
Uncertainty in project scheduling	"It's hard to measure the time, say, how much it's going to take you to program certain thing" (PM1)
Difficult to predict outcome parameters	"We can't show a client how the banner will look like on some Google platforms... it is very complex to display the final result in digital projects" (PM3) "The clarity of the result you're aiming for ... the result you are aiming for, if we are talking about complex projects, it is not always clear what we want here" (PM4)

Next, the challenges of digital project management, which are most often faced by DMA project managers, are discussed, as well as the methods to solve it. According to the project managers, the most common challenges are:

- Communication with the team.
- Technical uncertainties.
- Communication with the clients.
- Scope management.
- Planning.

Citations to support these challenges are given in the table below (see Table VII).

TABLE VII. ANSWERS ON DIGITAL PROJECT MANAGEMENT CHALLENGES

Challenge	Answer to 2.3. question
Communication with the team	"The main challenge is communication ... people often have different interpretations of how something should be done" (PM1)
Technical uncertainties	"It's me who often comes across questions with technical things" (PM2)
Communication with the clients	"When working in an agency, it is difficult that you cannot simply decide everything by yourself and make the best option, you still need to convince the client" (PM2) "First of all, there are a lot of demanding customers, and this is the biggest challenge" (PM3)
Scope management	"Scope management challenges and problems when the client imagines one way and we imagine another" (PM4)
Planning	"It seems to me that we have a problem with planning ... both at the project and the organizational level" (PM4)

The above-indicated challenges are quite diverse and require different competencies to solve them, both technical knowledge and soft skills. The DMA project managers were as well suggesting solutions to overcome the problems (i.e., answering 2.4 question). Firstly, to increase the levels of communication and constantly monitor the project implementation, it was proposed to plan weekly meetings, during which progress and current issues would be briefly discussed. Secondly, it was suggested to overcome the challenges of technical uncertainties by an individual search for information or consulting with the colleagues who have specialised technical knowledge. To continue with, it was proposed to improve the communication with clients by maintaining regular communication, establishing close relationships, and objectively basing all decisions on data. According to the interviewees, scope management could be more efficient if the projects would be planned more carefully and consistently; also, if communication with the sales team is improved. Ultimately, as DMA employees agree, the project planning process would be much more effective if proper

forecasting is done in the beginning and the workload is more adequately distributed among the managers.

After evaluating the interviewees' conception of digital projects and digital project management, their experience with various management challenges and potential solutions, the next part of the analysis will be devoted to the identification of the core DPM competencies.

TABLE VIII. ANSWERS ON THE MOST IMPORTANT DIGITAL PROJECT MANAGEMENT COMPETENCIES

Competence	Answer to 3.1. question
Contextual knowledge	"You must have digital marketing-related knowledge" (PM1) "The basis, if you work, as an example, with four different digital marketing areas, then you must know at least some of them all" (PM2) "You should understand what search engine optimization or conversion rate optimisation is" (PM3) "A digital project manager has to fully understand the content of the project" (PM4)
Planning	"You need to be able to delegate, you have to be able to distribute the tasks" (PM1) "Compliance with strict deadlines is important and also the ability to plan everything" (PM3) "The ability to construct a project plan in a structured, systematic manner" (PM4)
Communication skills	"Communication with the customers" (PM1) "Presentation making, the ability to communicate, these are also important competencies"(PM3) "It is crucial to know how to communicate with both the client and the internal team"(PM4)
Adaptation to the fast-changing environment	"Digital area is actually developing very rapidly, it's about being interested in innovation" (PM2) "It's important to delve deeper into the new knowledge, to have the desire to learn the field, and to be the first one all the time" (PM3)
Time management	"It is very important to prioritise the tasks because sometimes you need to go deeper and sometimes it is enough to pass it through quite superficially" (PM2)
Monitoring and control	"Project management is like making pancakes - if you turn away, it will burn [...] everything needs to be supervised and agreed upon" (PM2)
Empathy	"First it's empathy, I think it is a must" (PM3)
Conflict management	"Conflict management is a soft skill, but really necessary in digital project management" (PM3)
Data analytics	"Project management tools and digital analytics are essential [...] one must be able to understand and assess those metrics" (PM3)
Risk management	"The ability to understand the fears of the client and find solutions for risk management" (PM3)

The Individual Competence Baseline prepared by the International Project Management Association (IPMA ICB) [13] is a global standard that defines the competencies required by individuals working in the fields of project, programme and portfolio management. It is visible that 40% of the competencies given in Table VII belong to the People section which defines personal and interpersonal skills required to succeed in projects (i.e., communication, adaptation, empathy, and conflict management). Another 40% fit in the Practice section that defines the technical aspects of managing projects, programmes and portfolios (i.e., planning, time management, monitoring and control, and risk management). 10% (1/10) of the DPM competencies identified by the DMA project managers belong to the Perspective section that defines the contextual competencies that must be navigated within and across the broader environment (i.e., contextual knowledge). Finally, the last

competence, i.e., data analytics, does not fully fit into the standard, hence it could be assigned to an additional section – Information Technologies.

During the interviews, the DMA project managers as well had an opportunity to evaluate their current skills (see Table IX):

TABLE IX. ANSWERS ON CURRENT PM COMPETENCIES

PM	Best-developed competencies (Answer to 3.3. question)	Least-developed competencies (Answer to 3.4. question)
PM1	Communication skills.	Contextual knowledge; Knowledge of project management methods.
PM2	Responsibility.	Communication skills; Information Technology skills.
PM3	Communication skills.	Planning; Time management.
PM4	Communication skills.	Planning.

Looking at the data presented in Table IX, as many as 75% of interview participants singled out the communication skills as their strongest competence (IPMA ICB People competence area). On the other, hand, 75% of the interviewees identified their least-developed competencies that belong to IPMA ICB Practice competence section, hence suggesting that the Digital Marketing Agency and its' employees should pay more attention to this area.

The next part of the interview aims to find out how digital project management competencies could be developed. This broad question was analyzed from two perspectives: the organization (question 4.1) and the project manager as an individual (question 4.2). During the interviews, the DMA project managers distinguished the ways of improving the DPM competencies at the organisational level:

- Mistake-friendly environment (e.g., "When you know that there is nothing bad in making a mistake, you can experiment more courageously and learn from it" (PM1)).
- Online training (e.g., "Online project management training [...] It would help, I think" (PM3)).
- Internal training (e.g., "From the side of the organization, I see the possibility of organizing both theoretical and practical sessions" (PM4)).
- Learning by doing (e.g., "To test certain types of work done by specialists" (PM3)).
- Mentorship (e.g., "If you are a junior or mid-level specialist, it is always good to have a master nearby from whom you can learn" (PM2)).
- Coaching (e.g., "Also, it would be great to have an external coach capable of educating project managers by assisting and advising them" (PM4)).

These initiatives would not only improve the entire area of project management in the company but also provide a sense of motivation and personal development for employees (project managers). During the interviews, the DMA project managers as well shared insights on what is necessary/how they personally could improve their digital project management competencies:

- Motivation to learn (e.g., "After work, find time to read the book or watch a video" (PM1); "Project managers should show some kind of personal initiative" (PM4)).
- Challenges (e.g., "If you feel weaker in a certain area, then you can ask for more projects in the area you want to improve in" (PM2)).
- Online training (e.g., "The same online courses, just pick what you want to learn, and go do it" (PM2)); "Udemy, CXL and Coursera have countless of those trainings and certainly some are very good" (PM3)).
- Knowledge sharing (e.g., "If you don't understand something ... ask the specialist" (PM3); "Testing, sharing mutual experiences ... if you find reasons why you have done something unsuccessfully, let's share it so that it doesn't happen again" (PM4)).

To summarize, looking from the individual perspective, motivation to learn is very important as well as constantly facing challenges that would lead to learning. Also, to improve the least-developed competencies, the employees should share their knowledge within the team and organisation and use online training that may be considered as a very convenient way for the professional progress.

The next section will condense the research results and propose a structured plan on how to solve the problem of competence gap.

IV. RELEVANCE FOR PRACTICE

Rupeika-Apoga, Petrovska and Bule [14] found that employees' digital capacity had a positive direct effect on the digital transformation of SMEs during COVID-19 pandemic. Together with mathematical and analytical skills or knowledge of website development, digital project management skills were also attributed to the digital capabilities that have a positive impact on digital innovation and strong leadership during turbulent times. Similar findings [15] – [16] confirm the high value of DPM competencies and if an example of marketing is taken, 46% of marketers approve that they lack digital project management skills [17].

Hence, based on the scientific literature review and the findings of semi-structured interviews, the following steps as a plan to improve the digital project management competencies of DMA project managers are proposed:

- **To form an environment conducive to learning.** In this case, DMA should not only provide opportunities for project managers to improve their competencies, but also promote a certain culture in the company. This would ensure both the personal and professional growth of project managers. The necessity to implement a supportive learning environment that would back up competence development efforts in SMEs is also discussed in Evans and Waite [18] and Halvarsson Lundkvist and Gustavsson [19].
- **To organize internal knowledge-sharing sessions.** During these trainings, project managers could share their successful and unsuccessful digital projects, experiences, and knowledge, and look for solutions to problems that have arisen. This would help to strengthen the internal connection between project managers and ensure that information is shared with colleagues within the company. According to research

[20], knowledge sharing positively and significantly contributes to individual competence development.

- **To promote internal mentoring/job shadowing.** This method is especially useful for junior and mid-level project managers. The mentees usually emphasize the following benefits of mentoring programmes: soft gains, relation building, support and experience sharing [21].
- **To use external coaching services.** In this case, an external coaching specialist would be hired for DMA project managers, giving them external insights and advice on the arising issues. Findings suggest that coaching can have a significant impact on leader performance, work engagement, and career satisfaction [22].
- **To provide opportunities to attend PM courses online.** In this case, DMA project managers would be encouraged to learn individually and gain experience from already prepared online project management trainings, which could help in discovering new information that may be applied in their daily job. In general, e-learning is widely recognized as part of a sustainable training strategy in any SME [23].
- **To fund the participation in professional project management conferences.** This works as a way to get acquainted with project managers working in other companies, discuss the most important problems and share experiences.

When the digital project management competence development plan is implemented, it is recommended to continue the same sequence of processes that were described in Section II. I.e., to begin with the assessment of PM competencies, then proposing a plan for improvement and ending with its implementation. Based on this strategy, DMA would promote a culture of continuous learning, give project managers more motivation and ensure being among those organizations that are able to adapt to the rapid digital transformations.

V. CONCLUSION

Automation, the increasing number of communication channels, pressure for the shorter timeframes for project implementation, and the general digitalization tendencies require new digital project management skills. Therefore, investing in competence development is a path not only to increase the value of a company's human and intellectual capital but also to stay stable in the competitive market.

The global digital marketing market reached a value of nearly USD 321 billion in 2022 and is further expected to grow to reach around USD 671.86 billion by 2028 [24]. Thus, a case study of a digital marketing agency was chosen to analyse the core digital project management competencies and identify areas for improvement. During the interviews with the project managers, it was found that the most important competencies of digital project management are contextual knowledge, planning, communication skills, and the ability to adapt to a fast-changing environment. Also, skills of time management, monitoring and control, conflict management, risk management, data analytics, and empathy were identified as necessary while managing digital projects.

As properly developed project management competencies are among the most critical factors contributing to effective project management, the current status of skills was evaluated, and an improvement plan was proposed. The mistake-friendly atmosphere and learning environment, internal knowledge sharing sessions, mentoring/job shadowing, external coaching services, online PM courses, and PM conferences were offered as steps for the DPM competence development. Having in mind the exponential pace of digitization, the plan is ought to help in upskilling and reskilling the necessary talents in the area of digital project management.

ACKNOWLEDGEMENT

The paper is based on the thesis "Improvement of Digital Project Management Competencies at the Digital Marketing Agency" (author: Simonas Steponaitis, supervisor: Assoc. Prof. Dr. Meda Andrijauskienė).
