Abstract— The development of technology and information has changed consumer behavior. Hence, the marketing strategy challenge lies in how effectively it can increase awareness, conversion, and repurchase behavior as the determinants of e-commerce business sustainability. This study explores the influence of digital marketing, brand awareness, and customer relationship management on repurchase intention, with brand trust mediating variables in the e-commerce marketplace. The research analysis tool is SmartPLS 3.0, which shows an influence between digital marketing, customer relationship marketing, and brand trust on repurchase intention. Hence, digital marketing, customer relationship management, and brand awareness must be considered by digital marketers in the e-commerce marketplace to increase repurchase intention. The research is expected to provide managerial implications in the form of contributions to the e-commerce marketplace regarding how effectively digital marketing can reach consumers and inform them about new products, offers, discounts, or promotions that increase conversion rates in the e-commerce marketplace.

Keywords—digital marketing, customer relationship management, brand awareness, brand trust, and repurchase intention.

I. INTRODUCTION (HEADING 1)

The rapid development of information and technology is one of the most significant contributors to the impact of behavior change in today's society. This can be seen from the development of information technology in various countries worldwide, which has increased significantly from year to year [1]. Indonesia is a developing country with the most significant number of residents in the world, making Indonesia a potential country using the Internet as a medium for activity [2]. The increasing number of internet users in Indonesia annually impacts the trend of promotion from printed to digital ads [3]. Meanwhile, the most significant e-commerce users, the Z-generation, are more

interested in making purchases through their mobile phones [4].

Few previous research has suggested the positive influence of digital marketing on repurchase intention in e-commerce [5] [6]. The e-commerce marketplace, which has grown into a super app, also integrates its promotional strategy with social media, which is the main medium for customer relationship management [7] [8]. On the other hand, several studies state that customer relationship management is a sustainable marketing strategy, which is proven to increase consumer interest and intention to repurchase products because it can build engagement and loyalty through continuous information updates and fast feedback [9][10]. Effective customer relationship management is an important element in maintaining trust and increasing the number of loyal customers, thereby increasing consumers' desire to repurchase products [11] [12]. However, more research is needed to explore the influence of digital marketing strategy, customer relationship management, and brand awareness on repurchase intention simultaneously. Therefore, this research intends to fill this gap by determining the influence of digital marketing strategy, customer relationship management, and brand awareness on repurchase intention, with brand trust as a mediating variable.

The research is expected to provide managerial implications in the form of contributions to the e-commerce marketplace regarding how effectively digital marketing can reach consumers and inform them about new products, offers, discounts, or promotions. This is because consumers tend to buy a product with a unique value proposition, building trust in the company and its products. With the role of digital marketing, which can automatically track consumer behavior and needs, e-commerce marketplace companies can use this data to design campaigns aimed at different segments and lead users.

This can help increase conversion rates more effectively than television and print ads.

II. LITERATURE REVIEW

A. Repurchase Intention

Repurchase Intention is a process that refers to customer tendencies or intentions to make purchases back in the future. This means the customer's interest or desire to return buy products and services from online platforms or marketplaces [13]. Customer relationship marketing and trust brands have a significant favorable influence on the intention to repeat purchases. In addition, brand trust has also been proven to mediate the connection between customer relationship marketing and repeat purchase intention, as well as between brand trust and repeated purchase intention [14].

B. Digital Marketing

Digital marketing is expanding various methods for promoting products and services through digital channels such as computers, telephones, handhelds, and other digital media. There is a positive relationship between digital marketing implementation and purchase intention [15]. Hence, the research hypothesis:

H1: Digital marketing positively and significantly affects online marketplace purchase intention.

C. Digital Marketing

Brand awareness is the awareness of a buyer to recognize and remember one brand, which is the embodiment of a certain product category [16]. Brand awareness is a buyer's awareness of recognizing and recalling a brand that embodies a specific product category. There is a mediating effect of perceived risk in a positive relationship between brand awareness and purchase intention in the e-commerce marketplace. So, the research hypothesis is:

H2: Brand awareness positively and significantly affects online marketplace purchase intention.

D. Customer Relationship Management

CRM is a closer acquaintance with each customer by creating two-way communication. This communication must be managed as a mutually beneficial relationship between the customer and the company [17]. There is a positive relationship between CRM and social media, which are starting to switch to online marketplaces such as Facebook. So, the research hypothesis:

H3: Customer relationship management positively and significantly affects purchase intention.

E. Brand Trust

Brand trust is a belief about a brand that reflects the consumer's association with the brand. Brand trust is customers' belief that the company or brand they choose can solve their problems, deserve their respect, and provide them with added value. Brand trust is the second most important reason, after price, why consumers and

businesses buy products and repurchase intention. Buyers are looking for companies that can deliver on brand promises. In building brand trust, companies must convince consumers to get the value they expect from the products as the primary motivation to repurchase e-commerce products [6] [18].

Hence, the research hypothesis is:

H4: Brand trust mediates the relationship between digital marketing and purchase intention.

H5: Brand trust mediates the relationship between brand awareness and purchase intention.

H6: Brand trust mediates the relationship between CRM and purchase intention.

H7: Brand trust positively and significantly affects repurchase intention.

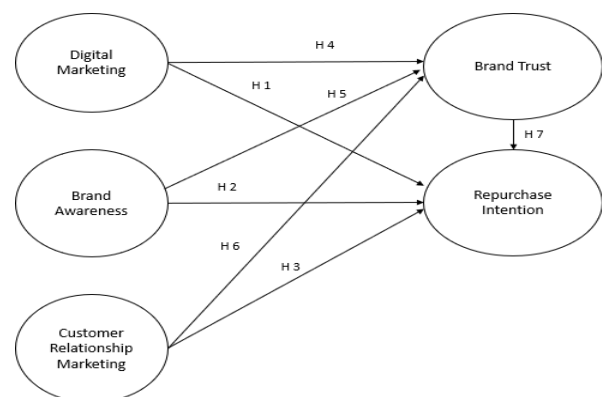

Fig.1. Research Framework

The model above explains the relationship between the independent variables, which consist of digital marketing, brand awareness, customer relationship marketing variables, brand trust mediation variables, and the dependent variable, repurchase intention. because marketers need to know what factors influence the level of a person's repurchase intention.

III. METHOD

This type of research is explanatory research. Explanatory research intends to explain the position of the variables studied and the influence between one variable and another. Based on the level explanation, this research is associative, namely explaining causality or causality to hide the relationship between two or more variables.

A. Population and Sample

In this study, the population was all consumers who had made purchases on the ABC e-commerce platform; in this study, the respondents were users of the ABC e-commerce platform. The sample in this research is part of the e-commerce marketplace users aged 17 years old, with a total purposive sample of about 200 respondents [19]

B. Data collection technique

Data collection techniques are the tools or methods used to collect research data, and they consist of techniques from questionnaires [20].

C. Data analysis technique

This study uses Structural Equation Modeling analysis (SEM), a statistical model series that explains the relationship between variables [19]. SEM analysis technique will test the research model designed with validity and reliability tests. Before that, the research model will be drawn using an Analysis of Moment Structures (AMOS).

IV. RESULT AND DISCUSSION

In PLS-SEM, convergent and discriminant validity exist. Convergent validity is a metric that occurs when a group of indicators represents one latent variable and the underlying latent variable. This can be proven to be unidimensional by establishing an AVE larger than 0.5. Conceptually diverse notions must differ sufficiently to be considered distinct. According to the Fornell-Lacker postulate, the latent variable will have a greater impact on the underlying indicator variable than other latent variables. This conclusion follows from statistical inference, and according to that inference, the AVE of each latent variable must have a value greater than or equal to the highest R^2 value with the values of the other latent variables. Based on Table 1, there are 33 valid items, 10 items on the digital marketing variable, 4 items on the brand awareness variable, 9 items on the customer relationship marketing variable, 5 items on the brand trust variable, and 5 items on the repurchase intention variable. These 33 items have a loading factor value of ≥ 0.50 . Based on Table 2, all variables have the value of construct reliability > 0.70 , so all variables in the study have reliability.

TABLE 1.

Convergent Validity Test			
Variable	Items	Loading Factor	Conclusion
Digital marketing	DM1	0.904	Valid
	DM2	0.879	Valid
	DM3	0.866	Valid
	DM4	0.873	Valid
	DM5	0.926	Valid

	RI4	0.851	Valid
	RI5	0.829	Valid

TABLE 2.

Construct Reliability		
Variable	Reliability Construct	Conclusion
Digital marketing	0.849	Reliable
Brand awareness	0.895	Reliable
Customer relationship marketing	0.940	Reliable
Brand trust	0.859	Reliable
Repurchase intention	0.920	Reliable

TABLE 3.

Regression weight			
Path	Critical ratio	P	Conclusion
H1 Digital marketing $\rightarrow$ repurchase intention	5,991	0.000	Significant
H2 Brand awareness $\rightarrow$ repurchase intention	0.988	0.323	Not Significant
H3 Customer relationship marketing $\rightarrow$ Repurchase Intention	-3,048	0.002	Significant
H4 Digital marketing $\rightarrow$ Brand trust	-3,410	0.000	Significant
H5 Brand awareness $\rightarrow$ Brand trust	3,785	0.000	Significant
H6 Customer relationship marketing $\rightarrow$ Brand trust	-3,676	0.000	Significant
H7 Brand trust $\rightarrow$ Repurchase intention	2,663	0.008	Significant

Based on the hypothesis testing, digital marketing, customer relationship marketing, and brand trust are positively correlates on repurchase intention (H1, H3 and H4

accepted). This result supports the previous research [1] [2] [3] that stated digital marketing strategy, which is supported by continuous customer relationship marketing in e-commerce, has positively influenced brand trust and loyalty and triggered consumers to repurchase in the e-commerce platform.

Nevertheless, brand awareness does not positively correlate with repurchase intention (H2 rejected). This confirms several previous studies that stated that in monopolistic market types such as e-commerce, especially with positioning as low-price e-commerce, where price competition is very tight, and many homogeneous products are offered. Features experienced in non-stop marketing and live selling can influence e-commerce consumers to switch brands according to their needs and preferences easily. This makes brand awareness not the main driver for e-commerce consumers to repurchase products [21] [22].

However, brand trust mediates the relationship between digital marketing and CRM on repurchase intention. (H4, H5, H6, H7 accepted). This shows that brand trust formed from frequent shopping with positive experiences in e-commerce mediates the influence of digital marketing strategies in e-commerce and customer relationship management on consumers' desire to reuse e-commerce platforms in the future. The results of this study support previous research [12] [13].

V. CONCLUSION

The results of the research conclude that there is a positive influence of digital marketing strategy with brand trust and repurchase intention in the e-commerce marketplace, which shows relevance to the results of previous research and behavioral trends of e-commerce marketplace consumers, the majority of Gen-Z who use social media. However, brand awareness does not directly influence repurchase intention; showing brand uniqueness, quality product/service offering, and consumer insight into the brand does not determine consumer behavior to repurchase products in highly competitive e-commerce marketplaces. This indicates the characteristics of Gen-Z consumers who are brand switchers. Meanwhile, consumer relationship management is also still effective in increasing repurchase intention because it can build engagement and loyalty through continuous information updates, fast feedback, and optimized after-sales service.

The limitation of this research is that the respondents came from one marketplace with a lower middle market segment that is price sensitive, so the research results cannot generalize the phenomenon of consumer behavior across marketplaces in Indonesia. Hence, the recommendation for future research is to add more respondents and classify respondent characteristics based on demographic, psychographic, and behavioral factors from various marketplaces to produce more comprehensive analysis.

ACKNOWLEDGMENT (Heading 5)

The authors thank Universitas Negeri Surabaya for providing support for conducting research.
