jcortega@feutech.edu.ph

Abstract— Artificial intelligence (AI) is becoming a disruptive force in digital marketing and advertising in the Philippines, transforming how brands plan, execute, and engage with their audiences. This study explores the impact of AI technologies such as automated targeting, personalized content delivery, and campaign optimization on industry practices and professional skillsets. Using the Task Technology Fit (TTF) Model and sentiment analysis, the research identifies a growing dependence on AI tools alongside significant challenges. These include a shortage of AI-related training opportunities, limited institutional support, and ethical concerns related to privacy and algorithmic bias. Despite these obstacles, there is cautious optimism among marketing professionals regarding AI's potential to enhance creativity, efficiency, and strategic decision-making. The findings emphasize the importance of developing human-AI collaboration frameworks, strengthening ethical standards, and promoting AI literacy across sectors. Collaboration among educational institutions, industry leaders, and policymakers is essential to building a resilient and future-ready advertising workforce in the Philippines.

Keywords— *Artificial Intelligence, Digital Media, Content Creation, Advertising, Marketing, Educational Technology*

I. INTRODUCTION

The integration of artificial intelligence (AI) into marketing and advertising has introduced significant disruptions to traditional methods, particularly in how businesses design, implement, and evaluate campaigns. In recent developments, core marketing activities such as segment targeting, content customization, and customer interaction have been redefined by AI's capacity to process complex data sets and anticipate user behavior patterns [2][3]. Tools powered by AI now allow marketers to execute precision-targeted strategies and deliver personalized content at scale [6], improving the chances of reaching consumers with relevant messages at optimal times [8]. This predictive capability enhances campaign effectiveness,

often translating to improved conversion rates and stronger returns on investment.

The efficiency offered by AI extends beyond analytics. Content generation and campaign execution have also become more streamlined, with machine learning applications capable of generating visuals and writing ad copy autonomously [9], while also managing real-time media buying to maximize performance [5]. Furthermore, AI-driven interfaces like chatbots and virtual assistants have transformed customer support systems, enabling faster and more tailored responses to user inquiries [4][7]. These developments are contributing to a shift in digital marketing toward approaches that are not only faster and more cost-effective but also increasingly centered on individual user experiences [13].

Nonetheless, the rise of AI in marketing is accompanied by pressing concerns. As companies move toward AI adoption, they must contend with complex challenges, including ethical risks such as bias in algorithms and threats to consumer data privacy [11]. Additionally, organizations face structural barriers such as the high costs of AI integration [10] and a shortage of professionals with adequate training in AI-specific tools and systems [12]. Despite these concerns, scholarly consensus suggests that AI will remain a catalyst for innovation within the advertising sector [14]. Reviews of current trends indicate that AI is reshaping the field across critical dimensions such as automated targeting, creative development, content personalization, and real-time ad optimization [16][24]. These shifts also spark ongoing discussions about maintaining ethical standards and ensuring that human oversight remains part of marketing strategies as automation expands [15][17].

In the context of the Philippines, the digital marketing industry is beginning to adopt AI technologies in ways that mirror global trends, though at a more gradual pace. Applications such as social media monitoring [33], automated ad placements, and AI-based recommendation engines in e-

commerce are becoming more common, especially among larger enterprises. These systems allow local businesses to enhance consumer experiences through behavior-driven suggestions and curated promotions, which are especially valuable in a fast-evolving, consumer-oriented market [1]. While AI projects are still developing in the country, there is growing recognition of their potential to contribute to the digital economy [35]. Companies are increasingly experimenting with AI-enhanced campaigns, while marketers seek opportunities to reskill and respond to new industry demands. However, the full potential of AI remains limited by challenges in accessibility, especially among small and medium enterprises that struggle with limited resources, infrastructure gaps, and the need for upskilling [36].

Early observations on AI implementation in the Philippines suggest a cautious yet optimistic trajectory. Although initial uptake was relatively slow compared to more advanced economies, reports indicate strong prospects for its growth in areas like predictive analytics, customer segmentation, and real-time engagement. According to a regional study, nearly 48 percent of job tasks in the Philippines have the potential to be automated by AI technologies, placing marketing among the sectors most likely to experience significant transformation. As AI tools continue to shape digital marketing and advertising practices, businesses in the country are exploring chatbots and other interactive technologies to enhance customer engagement and operational efficiency. These developments signal a broader shift toward innovation, as local companies seek to remain competitive and responsive in a rapidly digitizing marketplace.

Fig. 1. Positive Outlook on AI by Generation

Fig. 2. AI Usage by Generation

Public sentiment toward artificial intelligence in the Philippines has generally been marked by openness and enthusiasm. Recent data shows that Filipinos across various age groups view AI through an optimistic lens. According to a 2024 study, favorable perceptions are particularly strong among Gen Z (78%), with Millennials and Gen X close behind at 71%, and even Boomers showing an unexpectedly high approval rate of 68%. Usage patterns mirror these attitudes, with approximately half of the population reporting recent interaction with AI-powered tools, and Gen Z again leading in adoption at 52% [29]. These figures indicate not just curiosity but an increasing comfort with AI applications in everyday life and work, suggesting a population primed for more immersive AI experiences.

In response, Philippine businesses are progressively embedding AI into core operations. Industries such as retail, finance, and outsourcing are leading the charge by adopting intelligent systems to streamline processes and tailor services to

consumer needs. Emerging tech enterprises and digital-first platforms—such as fintech brands like Maya and on-demand services like Grab—are leveraging AI to automate decision-making and deliver personalized experiences. While most AI tools currently in use are built on international platforms, there is growing momentum toward developing local AI capabilities. Philippine universities, startups, and research institutions are beginning to invest in indigenous AI projects, signaling a shift toward more self-sustained innovation in the field.

One illustrative case is the SM Group, a major player in the retail sector, which has begun utilizing AI to transform customer engagement strategies. Through in-mall personalization initiatives, customers now receive targeted promotions upon arrival, enhancing both relevance and user experience. The company is also piloting the use of AI-generated creative materials for advertising, balancing efficiency with the need to maintain cohesive brand storytelling [22]. This example reflects a broader trend among large firms that are experimenting with AI not only for operational gains but also to refine how they connect with audiences. However, such innovations also raise important questions about how far automation should go, particularly in preserving human creativity and brand authenticity.

Fig. 3. Sample of a Poster Featuring AI-Generated Elements

The Philippine government has acknowledged the critical role of artificial intelligence in national development, particularly in driving digital transformation across sectors. Key policy efforts, including the Philippine AI Roadmap and proposed legislation for the establishment of a National AI Center, signal an intent to shape a future where AI is not only widely adopted but also ethically managed [29]. Although some of these programs are still in the early stages of implementation, they reflect a forward-looking stance that positions AI as a catalyst for economic progress.

Within the advertising and marketing sector, this institutional support is helping fuel a broader shift toward experimentation and capacity-building. Many companies are now exploring AI-powered strategies—from automation in campaign delivery to the use of predictive models for consumer targeting. At the same time, marketing professionals are increasingly investing in AI literacy through training and upskilling initiatives. Encouragingly, the public's generally favorable perception of AI provides fertile ground for businesses to innovate without facing significant cultural or consumer resistance.

Despite these positive developments, barriers persist. Small and medium enterprises, in particular, face difficulties in accessing advanced AI technologies due to financial and technical constraints. Furthermore, there is a continued need to modernize digital infrastructure and develop local talent

equipped to manage and scale AI tools effectively. Addressing these challenges will be essential to ensuring that the benefits of AI disruption in advertising are widely shared and sustainably implemented across the Philippine business landscape.

A. Statement of the Problem

1. Addressing the AI-Driven Skills Gap in Marketing

The acceleration of AI use within the marketing industry has exposed a pressing shortage of talent equipped with relevant technological expertise. Currently, around 80% of employers seek candidates with AI proficiency, yet 75% report challenges in recruiting individuals who meet these expectations. This disconnect highlights the urgent need for higher education institutions and professional development programs to realign their curricula and training frameworks, prioritizing skills in artificial intelligence and data-driven decision-making [34].

2. Reshaping Marketing Careers Amid Automation

As AI systems increasingly take over repetitive and analytical tasks, an estimated 48% of job functions in the Philippines—including foundational marketing responsibilities such as data analysis and entry-level content production—are at risk of automation [29]. This trend signals a shift in the nature of marketing roles, pushing professionals to cultivate competencies that AI cannot replicate easily. Skills such as critical thinking, storytelling, strategic planning, and emotional intelligence are becoming more valuable, as marketing careers evolve to emphasize human insight over mechanical execution [23].

3. Confronting Ethical Dilemmas in AI-Powered Advertising

With the rise of AI in marketing, ethical considerations have moved to the forefront of industry discussions. Issues such as user data protection, algorithmic discrimination, and opaque decision-making processes have drawn increasing scrutiny [30]. To build and maintain consumer trust, marketers must prioritize responsible data usage, implement safeguards against bias, and ensure that automated strategies uphold transparency and fairness [31][32].

4. Integrating Generative AI Without Replacing Human Creativity

Generative AI tools now enable rapid content production from copywriting to visual design and posing both efficiency gains and risks to creative professions. Reports suggest that as much as 25% of creative tasks could be automated, raising concerns about the future of roles in design and content creation [21][20][25]. To navigate this tension, the industry must adopt a collaborative model where AI serves as a creative enhancer rather than a replacement. Human input remains critical for producing emotionally resonant, culturally relevant, and brand-consistent messaging [22][28].

5. Maintaining Human Touch in an AI-Dominated Landscape

Although AI allows for highly personalized engagement at scale, there is growing concern that automated interactions may diminish the warmth and authenticity consumers expect from brands [26]. Over-reliance on machine-generated communication risks making brand messaging feel detached or generic. Marketers must therefore design strategies that combine AI's efficiency with human empathy, ensuring that technology enhances relationships rather than erodes them [27].

II. METHODS

A. Theoretical Framework of AI Adoption on Digital Marketing and Advertising in the Philippines

The Task Technology Fit (TTF) Model explains how technology enhances performance when it aligns well with the specific tasks users need to perform. It focuses on the degree to which a technology's capabilities match the requirements of the job. When there is a strong fit, users are more likely to adopt and effectively use the technology, leading to better outcomes. The model shifts attention from simply having access to technology to how well it supports task completion. [12]

Fig. 4. Task-Technology Fit Model

In this research on AI's disruptive influence in Philippine digital marketing and advertising, the TTF Model serves as a framework to assess whether AI tools genuinely support marketing tasks such as audience targeting, content creation, and campaign management. It helps identify whether the tools meet the needs of marketers and highlights barriers like skill gaps or poor tool-task alignment. This framework allows for a structured evaluation of AI adoption based on task relevance and practical usefulness.

Additionally, a questionnaire was distributed to 50 participants which aims to assess their experiences, viewpoints, and concerns about the disruptive influence and impact of AI on digital marketing and advertising in the Philippines.

1. How has the integration of AI changed the way you or your organization approaches digital marketing strategies?
2. What specific AI tools or platforms have you adopted, and how effective have they been in supporting your marketing objectives?
3. In what ways has AI improved or challenged your ability to engage with your target audience?
4. Can you describe any shifts in your team's roles or responsibilities since adopting AI in marketing or advertising efforts?

5. What challenges have you encountered in implementing AI technologies in your digital marketing campaigns?
6. How do you ensure that ethical considerations, such as data privacy and algorithmic fairness, are addressed in your use of AI?
7. From your experience, how does AI affect creativity and originality in advertising content?
8. How prepared do you think Filipino marketers are in terms of skills and knowledge to effectively use AI tools?
9. In your opinion, what impact does AI have on consumer trust and brand perception in the Philippine market?
10. What support or changes (e.g., training, infrastructure, policies) do you think are needed to maximize the benefits of AI in Philippine digital marketing?

B. Sentiment Analysis

To better understand participant sentiments, a sentiment analysis was conducted on the survey data. This approach examines the overall emotional tone of responses, highlighting key sentiments such as positive, negative, or neutral. A sample code snippet is provided below:

```
from textblob import TextBlob
# Function to get sentiment polarity
def get_sentiment(text):
    return TextBlob(text).sentiment.polarity
# Apply sentiment analysis to each response
df["Sentiment"] = df.iloc[:, 1:].apply(lambda x: get_sentiment("
".join(x.astype(str))), axis=1)
# Calculate overall sentiment statistics
sentiment_summary = df["Sentiment"].describe()
sentiment_summary
```

III. CONCLUSION

A. Overview of Analysis of Task-Technology Fit Model to Survey Findings

To better understand how artificial intelligence (AI) is disrupting digital marketing and advertising in the Philippines, this study applied the Task-Technology Fit (TTF) Model as an analytical framework. By examining qualitative responses from 50 participants—including marketing professionals and business practitioners—the study mapped their experiences and perceptions onto key dimensions of the TTF model. This approach allowed for a structured evaluation of how well AI technologies align with marketing tasks, impact performance, and are supported by user capabilities and organizational environments. The following analysis summarizes these findings across six TTF dimensions, highlighting key trends, challenges, and opportunities in the local AI adoption landscape.

Fig. 5. Summary of AI Integration in Digital Marketing and Advertising based on Task-Technology Fit Model

1. Task-Technology Alignment (Q1, Q2)

This dimension received the highest number of responses, indicating that most participants are actively reflecting on how well AI tools match their marketing tasks. Responses often described how AI supports planning, automation, and campaign execution, suggesting that AI is seen as highly relevant to day-to-day marketing functions. However, differences in tool adoption and effectiveness also show that alignment varies across teams and sectors.

2. Performance Impact (Q3, Q7, Q9)

The second most discussed area revolves around how AI affects outcomes, such as engagement, content quality, and consumer trust. Participants noted that AI improves efficiency and personalization but also expressed concerns about content feeling impersonal or generic. These mixed perceptions reflect the growing need to balance automation with human-centered strategies to sustain brand connection and creative impact.

3. Technology Characteristics (Q5, Q6)

A significant portion of feedback focused on the limitations and risks of AI tools, particularly around usability, data reliability, privacy, and bias. Respondents highlighted common barriers like steep learning curves, cost, and ethical concerns, reinforcing the importance of refining AI tools to better fit marketing environments.

4. Task Characteristics (Q4)

Participants reported notable changes in job roles and workflows, showing how AI is reshaping what marketers actually do. There is a clear shift toward analytical and supervisory tasks, with AI taking over routine functions. This supports the TTF model's view that tasks must evolve alongside technology to maintain fit.

5. User Characteristics (Q8)

Responses under this dimension reveal a readiness gap, especially between younger and older marketers or large vs. small companies. Many noted a lack of formal training and uneven skill distribution, suggesting that even if AI tools are available, not all users are equally prepared to utilize them effectively.

6. Technology Support Environment (Q10)

This final dimension had fewer mentions but highlighted a strong demand for infrastructure, training, and institutional support. Many participants called for more localized education and government involvement to help small businesses and professionals catch up..

The responses suggest that AI tools are largely aligned with marketing tasks, and users recognize their potential for improved performance. However, challenges remain in technology usability, skill development, and ethical implementation. The TTF model helps frame these insights by showing that for AI to truly deliver value, there must be balance and not just between task and tool, but also between human capabilities, ethical safeguards, and institutional support.

B. Results of Sentiment Analysis

Fig. 6. Summary of Sentiment Analysis Results

The boxplot illustrates the sentiment distribution for each question answered by participants regarding AI's impact on digital marketing in the Philippines. Most responses hover around neutral to slightly positive sentiment (polarity > 0), with some variance per question. Questions related to perceived benefits (e.g., Q3 on personalization and efficiency) tend to have higher median sentiments, indicating favorable views. Conversely, challenges (e.g., Q5 on barriers) show wider sentiment spread and slightly more neutral to negative tones. This mixed sentiment reflects AI's disruptive role: while it introduces efficiency and innovation, it also raises concerns about trust, accessibility, and adaptation which aligns well with the study title's emphasis on disruption in marketing and advertising landscapes.

The integration of artificial intelligence into digital marketing and advertising in the Philippines is steadily advancing, with many organizations recognizing its potential to enhance campaign efficiency, personalization, and customer engagement. Insights drawn from the Task-Technology Fit (TTF) framework reveal that while there is strong alignment between AI tools and core marketing tasks, the extent of benefit varies depending on user expertise, available infrastructure, and organizational readiness. Marketing professionals increasingly rely on AI to automate repetitive tasks, analyze data, and improve targeting accuracy, yet concerns about ethical use, content authenticity, and user trust remain prevalent.

Despite AI's perceived usefulness, the research highlights persistent gaps in skills, training access, and support systems—particularly among small and medium enterprises (SMEs) and professionals outside major urban centers. The uneven pace of adoption suggests that while large brands and tech-forward companies are rapidly advancing, others are struggling to keep up due to limited resources and guidance. Without proper interventions, this digital divide could limit the inclusive and sustainable growth of AI-enhanced marketing in the country.

IV. RECOMMENDATIONS

To fully connect the disruptive potential of AI in Philippine digital marketing, there is a clear need to expand access to localized training and upskilling programs. Government agencies, academic institutions, and industry leaders should collaborate to offer workshops, certifications, and continuing education initiatives focused on AI literacy, ethical data practices, and digital creativity. These programs must also consider the unique challenges faced by regional marketers and SMEs, ensuring that AI knowledge is not concentrated only in large corporations or urban areas. As Filipino consumers become more open to AI-driven services, marketers must prioritize transparency, creativity, and empathy to maintain trust and relevance in an increasingly automated landscape.
